

SUBJECT: Weather Websites

The components of Dryvit's systems must be applied within the range of climatic conditions described in the Dryvit specification for that particular system. There are several web-based tools that are readily available and useful in planning business activities in order to minimize weather related delays and disruptions. These websites provide both predictive and historical weather information that is handy for the GCs and applicators in planning their work. Among those you may find useful are:

www.weather.com (The Weather Channel) provides 10 day regional forecast for most of North America. Individuals can access the regional forecasts even when they are far away from the region where the work is being done.

www.wunderground.com provides historical information on temperature, precipitation, humidity, dew point, and wind for almost every region in North America. They have drop down menus that can be navigated very easily. All you need to do is plug in the zip code or name of the city, and all the information is at your fingertips.

Ultimately, applicators and contractors are responsible to ensure that the products are applied under optimum weather conditions as described in product specifications.

If you have any questions regarding this document, please contact Dryvit at 800-556-7752, ext. 9.
